Here are the LaTeX formulas for key equations from my documents:

1. Dynamic Pi Transformation Equations

Dynamic Pi Formula

$$\pi_{\text{dynamic}} = \pi \cdot e^{-\Delta}$$

Refined Formula for Approaching 4

$$\pi_{\text{dynamic}} = 4 - (4 - \pi) e^{-\Delta}$$

Modified Schwarzschild Radius with

$$r_s = \frac{2GM}{c^2} \cdot \left(\frac{\pi_{\text{dynamic}}}{\pi} \right)$$

2. Dynamic Phi Transformation Equations

Dynamic Golden Ratio Formula

$$\phi_{\text{dynamic}} = \phi \cdot e^{-\Delta}$$

Modified Black Hole Entropy with

$$S = \frac{k_A}{4 \hbar G} \cdot \left(\frac{\phi_{\text{dynamic}}}{\phi} \right)$$

3. Unified Master Equation for Ω and ϕ

$$\Omega(\Delta) = \pi_{\text{dynamic}} \cdot \phi_{\text{dynamic}}$$

where:

$$\pi_{\text{dynamic}} = \pi e^{-\Delta}, \quad \phi_{\text{dynamic}} = \phi e^{-\Delta}$$

4. Applications of α and β

Modified Einstein Radius in Gravitational Lensing

$$\theta_E = \sqrt{\frac{4GM}{c^2} \cdot \frac{D_{ls}}{D_s D_l}} \cdot \left(\frac{\pi_{\text{dynamic}}}{\pi} \right)$$

Modified Schrödinger Equation with Dynamic π

$$-\frac{\hbar^2}{2m} \nabla^2 \psi + V \psi = E \psi, \quad \hbar \rightarrow \hbar \cdot \frac{\pi_{\text{dynamic}}}{\pi}$$

These equations formalize the idea that α and β dynamically shift under geometric folding and can influence fundamental physics.
